

28-2 ACL Troubleshooting – Lab Exercise

In this lab you will troubleshoot Access Control Lists.

Lab Topology

Load the Startup Configurations

Open the '28-2 ACL Troubleshooting.pkt' file in Packet Tracer to load the lab.

ACL Troubleshooting

The previous network administrator was tasked with securing the network as follows:

1. PC1 should be the only PC which can Telnet to any router. (The network managers are not concerned about securing Telnet from one router to another).
2. Ping should not work to R2.

The security configuration has been tested and management found the following problems:

1. PC1 cannot Telnet to any router. PC3 can Telnet to any router.
2. R1 can ping R2.

You have been brought in to help. View the configuration on R1 and R2 and then fix both problems.

The Telnet password is **Flackbox**
