

19-2 IGP Fundamentals Troubleshooting – Lab Exercise

In this lab you will troubleshoot the RIPv2 and EIGRP routing protocols.

Lab Topology

Load the Startup Configurations

Open the '19-2 IGP Fundamentals Troubleshooting.pkt' file in Packet Tracer to load the lab.

There are both RIP and EIGRP issues in this lab exercise, fix the RIP problems first.
When the RIP problems are solved the RIP routes will appear in the routing tables.
When the EIGRP problems are solved the EIGRP routes will replace the RIP routes.

RIP Troubleshooting

- 1) RIPv2 has been configured on the network but the routers are not learning remote routes.

Your task is to troubleshoot the configuration and ensure that all routers have routes to every 10.x.x.x network.

There is a configuration error on each router. You will need to find and fix all errors before the network will work properly.

EIGRP Troubleshooting

- 2) EIGRP has been configured on the network but the routers are not learning remote routes.

Your task is to troubleshoot the configuration and ensure that all routers have routes to every 10.x.x.x network.

There is a configuration error on each router. You will need to find and fix all errors before the network will work properly.

Note that some commands may be disabled during the CCNA exam so you should know the different troubleshooting commands.

You must not use the 'show running-configuration' command (or any derivative of it) in this EIGRP troubleshooting section.
